AMENDMENTS TO THE CLAIMS

Please amend Claims 1 and 16 as follows:

- 1 1. (Currently Amended) A process for routing packets through a load balancing array 2 of servers across a network in a computer environment, comprising the steps of: 3 providing a plurality of load balancing servers; providing at least one back end Web server; 5 wherein one of said load balancing servers is also a scheduler; 6 wherein all request packets from [[a]] clients destined for the load balancing array 7 are [[is]] routed through said scheduler; 8 wherein said scheduler routes and load balances said a request packet to a load 9 balancing server; wherein said load balancing server routes and load balances said request packet to a 10 11 back end Web server; wherein said back end Web server's response packet to said request packet is sent to 12 13 said load balancing server; and wherein said load balancing server sends said response packet directly to said client. 14 1 2. The process of Claim 1, wherein said scheduler routes and load balances client
- 1 3. The process of Claim 1, further comprising the steps of:
- detecting the failure of said scheduler; and
- 3 electing one of said load balancing servers as the new scheduler.

requests to itself.

1 4. The process of Claim 1, wherein said scheduler detects the failure of other load

balancing servers; and wherein said scheduler stops routing packets to any failed load

3 balancing servers.

2

- 1 5. The process of Claim 1, wherein said load balancing server schedules sessions to
- 2 back end Web servers based on a cookie or session ID.
- 1 6. The process of Claim 1, wherein said load balancing server uses cookie injection to
- 2 map a client to a specific back end Web server.
- 1 7. The process of Claim 1, wherein said load balancing server decrypts said request
- 2 packet if it is an SSL session before routing and load balancing said request packet to a back
- 3 end Web server.
- 1 8. The process of Claim 7, wherein said load balancing server encrypts said response
- 2 packet if it is an SSL session before sending said response packet directly to said client.
- 1 9. The process of Claim 1, wherein said load balancing server establishes a connection
- with said client and said client keeps said connection alive with said load balancing server.
- 1 10. The process of Claim 9, wherein said load balancing server performs URL based
- 2 scheduling of request packets.

1 11. The process of Claim 9, wherein said load balancing server performs hash

- 2 scheduling of request packets.
- 1 12. The process of Claim 1, wherein said load balancing server maintains persistent
- 2 connections in all its paths when required; and wherein said load balancing server uses hash
- 3 group based persistence to maintain its persistence tables.
- 1 13. The process of Claim 1, wherein said load balancing server detects if a back end
- Web server fails; and wherein said load balancing server stops routing request packets to
- 3 failed back end Web servers.
- 1 14. The process of Claim 1, further comprising the step of:
- 2 providing a content delivery network; and
- wherein said load balancing server modifies select URLs in the HTML page in said
- 4 response packet to serve them from said content delivery network.
- 1 15. The process of Claim 14, wherein HTML pages that have modified URLs are cached
- 2 to improve performance.
- 1 16. (Currently Amended) An apparatus for routing packets through a load balancing
- 2 array of servers across a network in a computer environment, comprising:
- a plurality of load balancing servers;
- 4 at least one back end Web server;
- 5 wherein one of said load balancing servers is also a scheduler:

6 wherein all request packets from [[a]] clients destined for the load balancing array.

- 7 <u>are</u> [[is]] routed through said scheduler;
- 8 wherein said scheduler routes and load balances said a request packet to a load
- 9 balancing server;
- wherein said load balancing server routes and load balances said request packet to a
- 11 back end Web server;
- wherein said back end Web server's response packet to said request packet is sent to
- said load balancing server; and
- wherein said load balancing server sends said response packet directly to said client.
- 1 17. The apparatus of Claim 16, wherein said scheduler routes and load balances client
- 2 requests to itself.
- 1 18. The apparatus of Claim 16, further comprising:
- a module for detecting the failure of said scheduler; and
- a module for electing one of said load balancing servers as the new scheduler.
- 1 19. The apparatus of Claim 16, wherein said scheduler detects the failure of other load
- 2 balancing servers; and wherein said scheduler stops routing packets to any failed load
- 3 balancing servers.
- 1 20. The apparatus of Claim 16, wherein said load balancing server schedules sessions to
- 2 back end Web servers based on a cookie or session ID.

1 21. The apparatus of Claim 16, wherein said load balancing server uses cookie injection

- 2 to map a client to a specific back end Web server.
- 1 22. The apparatus of Claim 16, wherein said load balancing server decrypts said request
- 2 packet if it is an SSL session before routing and load balancing said request packet to a back
- 3 end Web server.
- 1 23. The apparatus of Claim 22, wherein said load balancing server encrypts said
- 2 response packet if it is an SSL session before sending said response packet directly to said
- 3 client.
- 1 24. The apparatus of Claim 16, wherein said load balancing server establishes a
- 2 connection with said client and said client keeps said connection alive with said load
- 3 balancing server.
- 1 25. The apparatus of Claim 24, wherein said load balancing server performs URL based
- 2 scheduling of request packets.
- 1 26. The apparatus of Claim 24, wherein said load balancing server performs hash
- 2 scheduling of request packets.
- 1 27. The apparatus of Claim 16, wherein said load balancing server maintains persistent
- 2 connections in all its paths when required; and wherein said load balancing server uses hash

3 group based persistence to maintain its persistence tables.

- 1 28. The apparatus of Claim 16, wherein said load balancing server detects if a back end
- 2 Web server fails; and wherein said load balancing server stops routing request packets to
- 3 failed back end Web servers.
- 1 29. The apparatus of Claim 16, further comprising:
- 2 a content delivery network; and
- wherein said load balancing server modifies select URLs in the HTML page in said
- 4 response packet to serve them from said content delivery network.
- 1 30. The apparatus of Claim 29, wherein HTML pages that have modified URLs are
- 2 cached to improve performance.
